Day 06 Linked list =>

Limitations of Array => ① Fixed size
② Costly insertion
③ Memory waste
④ Deletion overhead.

Arraylist → dynamic array
↓
increase size *2
↓
and then copy the elements to new Arraylist
↓
internally Arraylist uses array
↓
⑥ Arraylist is also costly

Linked list → A linear datastructure with data and reference of another node

① Dynamic sizing
② Efficient insertion
③ Easy deletion
④ Memory efficient

In Linkedlist class in Java → doubly linked is used

which providing optimal performance for insertion and deletion

① part of collection framework
② performance benefits

All the methods are same of linked list as of arraylist

① list.add()
② list.addAll()
③ list.remove()
④ list.removeAll()

There is a descendingIterator(); → only present in LinkedList class

⑤ offer() → return boolean and use degree
↳ internally use add() method

⑥ offerFirst()
⑦ offerLast()
