Day 01 =>

Compile-time and logical error

```
int a = 5
int b;
cout [b]      // Compile-time error

int b = "Jenny";  // Compile-time error
```

Compile time error : Syntax error detected by the compiler, preventing the code from compiling - Example include missing semicolon, incorrect variable declaration

Logical error => Logical in error

↳ in this compilation error is not occured

Run time error => General run time errors are exception

but not all run times errors are exception

① Out-of-memory error

② Stack overflow error

Exceptions => exceptions are run time errors that disrupt the code of execution

not all the Runtime errors are exceptions

Causes of Exception => common reasons include file not found, network connection issues, invalid input, printer not connected, etc

To handle run time error =>

```
try { // in this object is created and sent to catch block for handling

}
catch ( exception e ){

}
finally { // it will always run irrespective of exception occur or not

}
```

try with multiple catch block

Syntax->

```
try {
}
catch (      ) {
}
catch ( ) {
}
finally {
}
```

must be subclass ≠ be superclass

must be superclass ≠ be subclass
