Day 09 ⇒ Priority Queue

- elements are served acc to priority
- uses heap datastructure

ex⇒ 3 1 23 50 2 55

lowest number = highest priority

Priority Queue used Binary Heap datastructure

- min heap
- max heap

Priority Queue uses Binary min heap datastructure

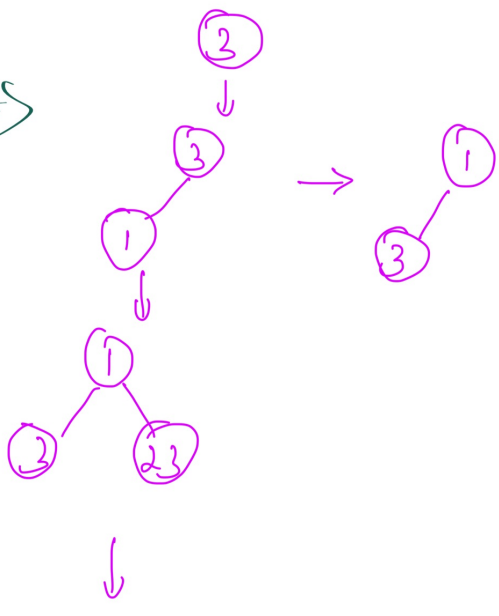

- should have to be Complete Binary tree
- have min element on the top

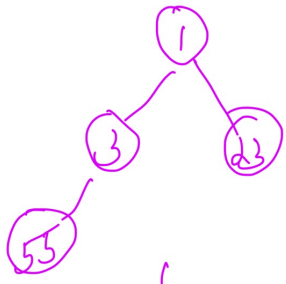

ex⇒

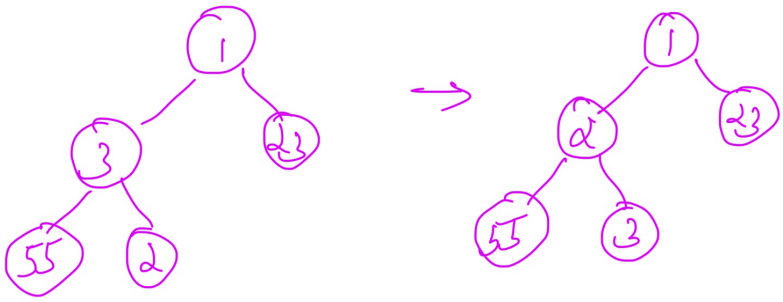

3	1	23	55	2	15
0	1	2	3	4	5

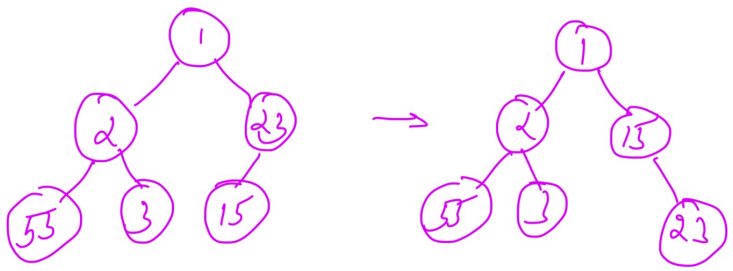

At time of insertion of min heap parent element is less than or equal to its children elements

Insertion of elements ⇒

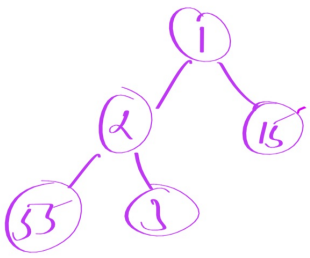

so it fails CBT property

so it is not satisfies min heap

Deletion => Lets take

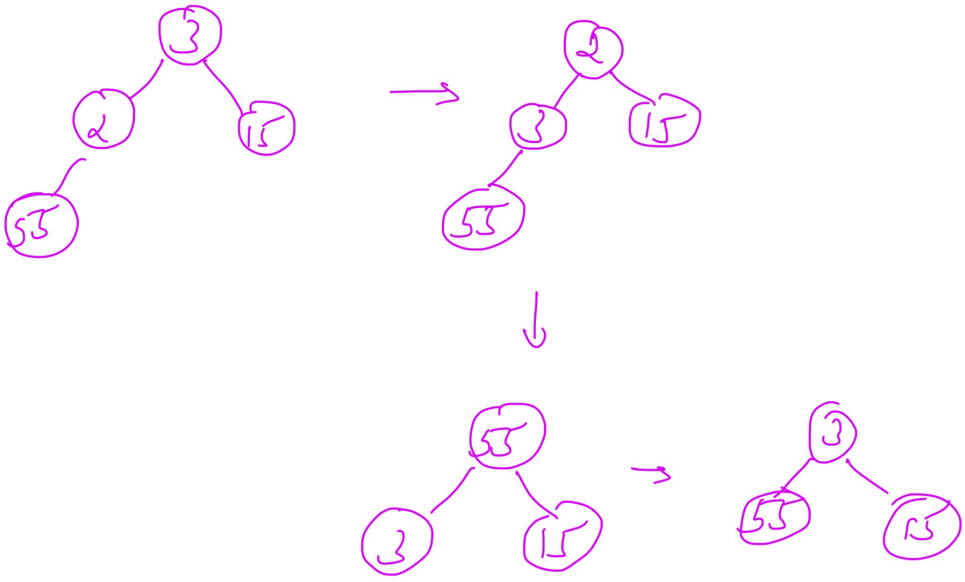

of elements

one

Note => In priority Queue Nulls are not allowed
